

Surface protection film

Kaindl Info_E
07

Status: March 2015

Page 1/1

The non-permanent surface protection film is design to protect Kaindl surface structure GL and UM against for example damages, scratches or dirt during transportation, further processing, assembly etc.

Technical data:

Total thickness:	44µm
Material:	Polyethylen (PE)
Adhesion system:	Natural rubber
Film colouring:	Transparent clear up to opaque
Outside application:	Just for inside use

Protect the material against strong influence of light (e.g. sun, illumination) and exposure to heat (e.g. heating appliances and radiant heaters). This might influence the technical properties of the surface protection film.

Do not expose neither the film nor the laminated material to high temperatures and avoid direct sun influence for a too long time. This may cause degradation of the plastic which may lead to negative influence on the technical properties of the material.

In generally, products with surface protection film shall be processed as soon as possible, however latest six months after delivery. Remove film after processing. If the surface protection remains on the surface for more than half a year, it might be difficult to remove because of the increased adhesion of the film.

Tip: In case of strong adhesion use a hairdryer to warm the surface protection film before removing. Possible residues of the adhesive on the surface of the board can be removed with acetone or other suitable solvents.

Used surface protection film has to be disposed suitable.
