Chestnut | Sweet Chestnut

Veneer thickness 0,6 mm

Description

The chestnut is a tree that loves warmth and is therefore frequently found in regions where wine is also grown. It is most widely spread around the Mediterranean. To the north of the Alps the sweet chestnut grows only in temperate climate zones.

The annual rings are very distinctive, so that the texture of the wood is very strong. The structure patterns are impressive crown and striped figures. The yellowish brown to mid-brown coloured wood presents itself with a decorative characters, indeed with a richly varied play of colours. The pores are very distinct and have the same texture as oak.

Principal occurrence

Asia, Europe, North America

Use

Furniture making, interior fitout and finishes

Classification E

Blossom of the sweet chestnut

Kaindl samples are supplied automatically from the sample stock, without consideration of the wood's texture or colouring. These samples represent the characteristics of the respective wood species; however, they do not establish any automatic claim to the appearance and quality of panel deliveries. The selection for projects takes place separately, after consultation with our relevant department.
