Status: March 2015

Page 1/2

### Initial cleaning

- Remove any loose dirt or dust with a **dry** microfiber cloth or statically loaded wipes.
- Do not use oil-impregnated or similar wipes. These may leave an unwanted oil film on the surface.
- In case of adherent dirt spray some „Tana Sprinter Power“ or „Frosch Soda Allzweck-Reiniger“ onto the wipe (folding technique) or direct onto the surface to be cleaned. Let the agent soak in for a moment. Then wipe dry.
- Initial surface cleaning is neither necessary nor recommended. Melamine resin surfaces require no special after-treatment.

### Everyday cleaning

- Remove loose dirt or dust with a slightly damp duster or microfiber cloth.
- For adherent dirt we recommend using „Tana Sprinter Power“ or „Frosch Soda Allzweck-Reiniger“ (spray onto the microfiber cloth or surface and wipe with a damp cloth). Universal, alcohol-based cleaners with a pH-value between 6 - 8 may also be used.
- In the case of isolated contaminations (e.g. paints, lacquers, hardened glues), we recommend you leave „Tana Sprinter Power“ to soak in for a few minutes and then wipe dry with a microfiber cloth.

### Please note!

Take care of the glued joints: only leave to soak for a moment.

### Caution

Under no circumstances must abrasive cleansers, waxes, oils, polishes or other protective agents be applied to the melamine resin surface!

The cleaners „Tana Sprinter Power“ and „Frosch Soda Allzweck-Reiniger“ have been approved for cleaning melamine resin surfaces and must be applied according to the manufacturers' instructions.
